Case Study

Automated Data Loading into Oracle Fusion Cloud, Ensured Data Accuracy

Summary

Calix upgraded their enterprise systems from Oracle E-Business Suite (EBS) 12 to Oracle Fusion Cloud ERP and Supply Chain. This major transformation involved several millions of Master and Transactional data migration, including reporting. Data conversion was a major activity for completing this project.

So, the client partnered with Forsys to seamlessly convert and migrate data to Oracle Fusion Cloud ERP and SCM.

Problem Statement

The main concerns of the client were:

- Oracle EBS Data structures for most modules is completely different from Oracle Fusion Cloud
- Oracle Fusion Cloud does not provide direct access to the Database
- Client had customized its Oracle EBS environment for over 10 years; so, the data structures had changed significantly
- Data Conversion involved multi stage process:
  - Identifying the objects to be migrated
  - Analyzing the data for its accuracy and work its business (data owner) teams for correction
  - Identifying the columns/attributes to be migrated
  - Documenting the rules to be applied to the data sets for conversion
  - Loading the data to File-Based Data Import (FBDI) and then to Oracle Fusion Cloud environment
- Reconciliation and data validation was a monolithic effort to ensure all the data sets are migrated to Oracle Fusion Cloud environment for business continuity

Solution

- Worked with business stakeholders to develop a data strategy for Financials and Supply Chain modules
- Analyzed master and transactional data sets for its accuracy. Worked with business teams to fix duplicates, invalid records, etc. Datasets that needed translation, include Suppliers, Customers, Employee information, Item Master,Categories, Bank Accounts, Fixed Assets, Vendor Invoices, AP Prepayments, Customer Invoices, Credit Memos, PO, SO, Work-Orders, Receipts etc., and its historical Data.
- Developed rule sets for applying to the data in each of these modules; developed validation rules to address data conversions
- Developed Data Sequencing models for loading the data based on their dependencies, such as Purchase Order (PO), Order Management (OM), Inventory (INV), Planning, and Global Order Promising (GOP), Install Base, Service Contracts, and Service Request
- Developed FloData Flows to automate data extraction, transformation, and loading into FBDI templates
- Automated uploading of the FBDI templates to Oracle Fusion Cloud environment and executing the scheduled jobs to load the data into the core objects
- Validated error records and worked with business stakeholders to address them. Iterated the process for loading the correct data to the cloud
- Developed Reconciliation strategy for validating the data from source and target
- Executed reconciliation scripts to ensure data accuracy and quality

Benefits

- **Automated the process of building FBDI templates and loading of data into Oracle Fusion Cloud environment**
- **Saved over 40 hours of manual effort especially during the production migration process**
- **Increased data migration success rate by validating master data and identifying issues ahead**
- **Used data reconciliation methodology to increase user adoption of the new systems**

About the Client

The client headquartered in San Jose, California, is a global leader in access innovation. Its Unified Access portfolio of broadband communications access software, systems, and services enables communications service providers worldwide to transform their networks and become the broadband provider of choice to their subscribers.
