FORSYS
Forward Thinking

40% Reduction In Testing Tasks For A Top Video Delivery Tech Firm With Forsys' Customized QA Automation Framework

Insight

A leading business in the video delivery technology sector grappled with the challenge of sustaining operational efficiency owing to an erratic production environment, a scarcity of users for testing, and the void of vital documentation. The absence of continuous testing processes, limited time for regression assessments, and the necessity for enhanced return on investment compounded these obstacles.

Forsys' Testing as a Service (TaaS) streamlined the client's testing processes, leveraging its Quality Automation Framework (QAF) to achieve faster market readiness, improved ROI, and quality assurance. As a result, the client achieved significant outcomes, including a 40% reduction in testing tasks, a 15% optimization of testing roles, cost savings ranging from 25% to 40%, etc.

Business Challenge

In the fast-paced and demanding field of video delivery technology, the client faced a multitude of business challenges, that impacted their operational efficiency and customer satisfaction, such as:

- Maintenance of a stable production environment
- Acute unavailability of business users to conduct essential testing
- Identification of defects at the staging phase before any manual validation
- Absence of comprehensive documentation
- Lack of continuous testing mechanisms
- Inadequate time to perform regression testing
- Absence of an organized framework to facilitate continuous testing
- ROI optimization by finding the perfect balance between manual & automated efforts
- Detection of performance-related issues in the application
- Creation of a comprehensive executive dashboard for real-time visibility into key performance metrics

Transformation Journey

Forsys' proficiency in providing Testing as a Service (TaaS) played a pivotal role in modernizing the client's testing processes and achieving the desired outcomes. This transformation was enabled through the implementation of Forsys' customized Quality Automation Framework (QAF) using Selenium, ensuring a quicker time to market and a faster ROI, all the while delivering assured quality results.

The key highlights of the transformation journey:

- Identification of the potential automation scope by working closely with the client's manual quality assurance and integration teams
- Utilization of the automation solution as a gatekeeper for customer production deployments
- Designing a bespoke end-to-end automation strategy from the ground up and selecting the most appropriate tools and techniques for their specific requirements.
- Implementation of a versatile, ready-to-use framework capable of deploying n any environment
- Integration of a performance matrix mechanism to identify system-related issues.
- Development of a fully automated solution with zero manual intervention using the Continuous Integration/Continuous Delivery (CI/CD) approach
- Early detection of defects prior to code deployment in the production environment
- Enabling script reuse across different platforms/environments for enhanced support

Impact

25-40%
cost savings

90%
accuracy through the use of automation

~40%
reduction in testing cycle time

40%
decline in testing tasks

>90%
accuracy through the use of automation

15%
optimization in testing roles

~95%
minimization of functional defects in production

About the Client

The customer is an American video delivery technology and services business that enables companies and service providers to deliver ultra-high-quality broadcast and OTT video services to consumers globally.

Solution Components

- **Selenium webdriver**
- **TestNG**
- **Page Object model**
- **Data driven approach**
- **Bitbucket**
- **Jenkins - CI/CD**
- **JIRA**
- **Confluence**
