Insight

A multinational conglomerate developing and manufactures audio, video, communications, and information technology products had a challenge in ingestion, analysis, and reporting on large volumes of new and updated data from various disparate data sources without disruptions.

Forsys implemented an analytics platform with twelve key transactional data sources for the client, which enabled them to standardize, automate, and consolidate data, merge it with existing tools, and make decisions five times faster.

Business Challenge

The client collated operational data from disparate data sources, such as budgets, campaign management, website, phone switches, service centers, Oracle ERP, and retail point-of-sale. The different business groups independently aggregated data and generated reports, which frequently led to inaccurate, inconsistent data flows.

The manual processing of the business data hampered the system's performance, impacted the day-to-day activities, and resulted in conflicting reports.

Transformation Journey

Forsys implemented Oracle Business Intelligence (BI) for the client and converted its business object applications to Oracle BI.

The notable highlights of the approach to the solution:

- Planning, development, documentation, and deployment of new ETL processes and dashboards to ease data access for the end-users.
- Standardization, automation, and consolidation of data and merging it with existing tools to deliver structured reporting.
- Auditing of existing reports and consumer data.

IMPACT

- **5X faster decisions.**
- **Agile implementation of market strategy backed by easy access.**
- **Tracking of campaign effectiveness across channels.**
- **Click stream analysis to determine the visit-to-buy ratio, abandonment, customer segment, and other pertinent statistics.**
- **Improvements in operational efficiency and client satisfaction.**

About the Client

The client is one of the world's largest conglomerates that develops and manufactures audio, video, communications, and information technology products for the consumer and professional markets.

Solution Components

Oracle BI, NetSuite, JIRA
