Case study

70% Faster Workflows Achieved Via E2E Automation with Salesforce Sales Cloud for a Leading Pharmaceutical Manufacturer

Insight

As a leading pharmaceutical manufacturing company, the client faced multiple challenges due to fragmented systems, limited visibility, and time-consuming manual processes for quotes, invoicing, and more. The lack of a unified platform, such as a CRM, caused data disconnections, impacting efficiency and customer experience.

Forsys developed and implemented a tailored Salesforce Sales Cloud solution, enabling the client to achieve a holistic sales transformation. This resulted in streamlined sales processes, enhanced deal closure speed, and improved productivity, with a 70% increase in operational efficiency and a 40% reduction in sales cycle time.

Business Challenge

Operational excellence and customer satisfaction are pivotal for the success of the client, a key player in the pharmaceutical and life sciences domain specializing in manufacturing essential drugs for day-to-day medicines. Unfortunately, their dependency on outdated in-house tools and manual processes led to fragmented systems, limited visibility across operations, and time-consuming tasks like generating quotes, managing invoices, and handling forms (e.g., dispatch advice, audits). Moreover, data silos became a critical issue in the absence of integration between systems, hindering efficient communication, tracking, and decision-making.

Here are several challenges the client faced:

- Fragmentation of sales processes across multiple tools and systems.
- Disjointed customer and sales data.
- Manual and time-consuming quoting, invoicing, and reporting.
- Inconsistent management of different forms, such as sample requests, dispatch advice, DMF/ Techpack, audit, and visit forms.
- Lack of defined strategies for prospect management.
- Absence of a unified process tracking system.

Transformation Journey

The client leveraged Forsys' expertise as an end-to-end Salesforce implementation partner to comprehensively address their operational inefficiencies and modernize their processes. Forsys initiated the journey with a thorough discovery phase, analyzing the client's workflows, systems, and pain points. Based on the insights gathered during this diagnostic phase, Forsys designed a tailored Salesforce Sales Cloud solution and implemented it using a phased rollout approach to ensure seamless adoption.

Here are the key highlights of the transformation journey:

- Unification of sales processes to ensure company-wide uniformity.
- Automation of quoting and reporting, eliminating manual inefficiencies.
- Centralization of customer data for improved relationship management.
- Real-time analytics and dashboards for actionable insights.
- Streamlined management of multiple forms, including Sample Requests, Dispatch Advices, DMF/Techpack, Audits, and Visit Forms, within Salesforce CRM.

Impact

- **70% reduction in sales cycle time**
- **60% increase in data accuracy**
- **Improvement in decision-making with real-time analytics**
- **Decline in administrative workload**
- **Introduction of the option to create multiple forms for customers.**

About the Client

The client, established in 2018, is a growing manufacturer of pharmaceutical APIs and intermediates and a leading company offering CRO/CDMO services to multinational companies and innovators across the world, enabling them to accelerate access to affordable medicines for patients worldwide. They offer small molecule drug discovery, process research and development, and custom synthesis services to various pharmaceutical and biotech companies globally.
