Case study

~70% Larger Payload Support Achieved with OIC Gen 3 Implementation for a Leading Financial Services Firm

Insight

A financial services leader faced mounting challenges in maintaining a secure, scalable, and efficient integration framework with Oracle Integration Cloud (OIC) Gen2 approaching its end-of-support deadline. Operational agility and compliance risks were ongoing concerns due to the platform's limited connectivity options, basic security features, and restricted automation. To build a future-ready infrastructure, the client recognized the urgent need to upgrade to OIC Gen3, which would ensure expanded integration, enhanced security capabilities, and streamlined automation.

Forsys, as an Oracle Partner, executed a structured migration from OIC Gen 2 and deployment of OIC Gen 3, which improved the client's system performance, connectivity, and usability. To achieve this, Forsys adopted a methodical process that included assessing 100+ active integrations, thorough testing across Dev and SIT, and a carefully planned deployment ensuring zero disruptions. Additionally, by using new adapters, establishing direct connections to private resources, and enhancing automation, the migration achieved a higher level of integration efficiency. As a result, the system now supports 50-70% larger payloads, enables 30-40% faster task completion with an enhanced UI, and reduces integration setup efforts by 40-60% with new adapters.

Business Challenge

With OIC Gen 2 set to be phased out, the financial services company faced an urgent need to modernize its integration framework. The lack of ongoing support for OIC Gen 2 posed considerable risks to business continuity, security, and operational efficiency.

Here are some of the key challenges the client faced:

- Limited integration flexibility
- Lack of advanced features in the existing security framework
- Security and compliance gaps
- Automation roadblocks
- Poor user experience

Transformation Journey

Forsys executed a meticulously planned migration strategy to migrate the company from OIC Gen 2 to Gen 3 with zero risk and maximum efficiency. The transformation journey started with a detailed assessment of 100+ active integrations, identifying and reviewing the dependencies and challenges. Forsys used a methodical approach to ensure and maintain business continuity, with a well-designed migration framework that included:

- ☑ Comprehensive assessment including an in-depth impact analysis of 100+ active integrations running in OIC Gen 2 to identify critical dependencies and challenges.
- ☑ Migration planning to categorize integrations based on priority, complexity, and dependencies, ensuring zero disruption.
- ☑ Thorough testing & validation ranging from Development (Dev) to System Integration Testing (SIT) to maintain seamless data flow.
- ☑ Structured deployment process using pre-defined metrics, ensuring all objects were categorized and dependencies were validated before implementation.
- ☑ Implementation of new adapters, direct private resource connections, and advanced security enhancements to strengthen compliance and data integrity.
- ☑ Post-deployment performance optimization & user enablement to maximize the capabilities of OIC Gen 3.

Impact

50-70% larger payload support, enabling complex integrations.

30-40% faster task completion with an enhanced UI.

40-60% less effort in integration setup with new adapters.

About the Client

The client is a US-based financial services company that provides an electronic trading platform facilitating trades of stocks, exchange-traded funds, options, index options, futures contracts, and outcomes on prediction markets and cryptocurrency. It also offers cryptocurrency wallets, credit cards, and other banking services.

Solution Components

OIC Gen 2, OIC Gen 3
