Case Study

Forsys streamlines demand management, sales & operations planning, and constrained supply with Oracle Planning Central Cloud for a global cooler manufacturer

About The Client

The client is a leading manufacturer of ice chests, drink containers, and supporting accessories since 1947. The Texas-based globally recognized manufacturer through its 500+ products offerings have played a crucial role in making the family outdoor recreation activities possible and feasible.

The Background

The client wanted to integrate multiple applications into a single cloud-based enterprise architecture that enabled business growth through a digital transformation and supported its efforts to boost operational excellence.

Dealing with operational challenges was one of the key factors that compelled the client to identify a technology solution that aligns with the business objectives and can push the company's growth forecast. The manufacturing giant came to realize it was time to replace the traditional business methods with technology-enabled business operations to speed up the transition to a next-gen technology-focused enterprise capable of navigating the complexities.

The Challenges

Understanding that a phased approach will work best, the client's main concern was to streamline the demand management process and the sales and operations planning in the first phase and go with the constrained supply plan in the second phase.

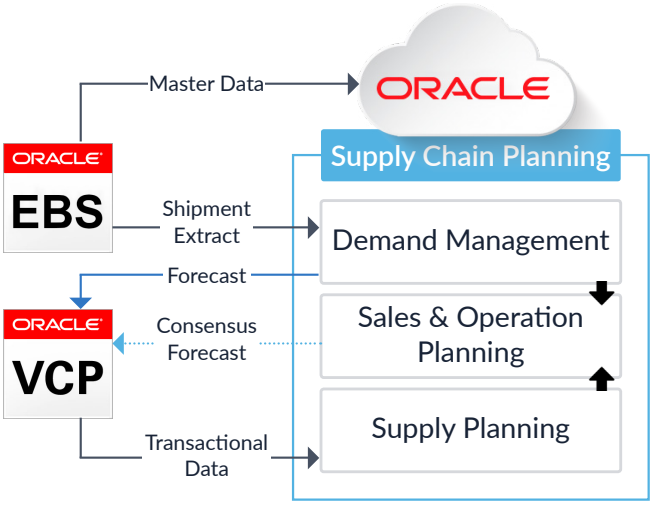
With over 500 products sold across hundreds of retailers around the globe, the client's decision to integrate multiple applications into a single cloud-based enterprise architecture was based on the below-mentioned challenges:

- Constantly growing demand patterns and lack of ability to forecast demand with greater accuracy.
- Heightened risks of supply disruption and lack of ability to identify risks and get rid of them.
- Unable to embrace and leverage varied fulfilment strategies within a single global supply chain plan.
- Absence of an integrated view of demand and supply across the chain.

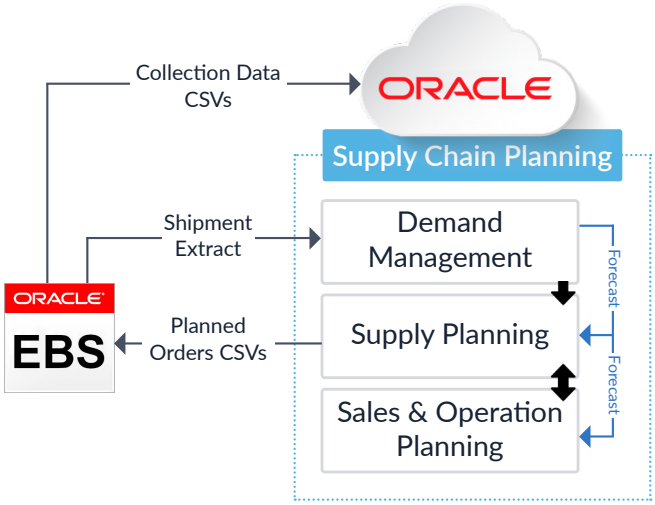
The Solution

Keen to address several key operational challenges, the client decided to deploy Planning Central to streamline and make improvements in demand planning, sales and operations planning and more. Moreover, it also wanted to move Planning Central to the cloud while retaining business transactions in Oracle E-Business Suite (EBS).

To realize value quickly and consistently for the client, the Forsys team developed a plan to implement the Planning Central leveraging their two-phased approach. Forsys used Flodata, a proprietary integration tool to connect the cloud and on-premise applications and integrate the data using File-Based Data Import (FBDI) templates. In this process, we mapped the attributes in the required FBDI templates from the Source EBS system. Flodata collected the master data and transaction data from the EBS source and loaded it into the Oracle Planning Central Cloud. With seamless data flow between the EBS system and Planning Central, the implementation process was simplified and accelerated.



Process Flow for Phase 1



Process Flow for Phase 2

Benefits & Results

Forsys' methodical approach ensured that the client's key objectives were achieved, enabling the business to run in the most optimized manner. The manufacturing giant was satisfied that it selected Forsys for it helped to achieve the below-mentioned results:

- Automation helped save time by 250%.
- Accurate forecasting led to on-time delivery and boosted the revenue stream.
- Optimized inventory management leading to $1 million in savings.
- Successful integrated supply chain planning and demand forecasting on the cloud.
- Find out the demand-supply balance of the stock keeping units leveraging the daily plans and simulation in real-time.
- Reduced end-to-end planning cycle time and planning frequency to quickly address demand variability.
- Boosted supply chain data accuracy and curtailed data latency.
- Reduced order-rescheduling instances & enhanced forecasting accuracy based on supply chain inventory.
