Implemented Oracle Planning Central, Boosted Supply Chain Accuracy

Summary

The client wanted to replace its traditional business methods and migrate to a cloud-based ecosystem to improve functional efficiency. The client also wanted to implement a technological solution that overcomes operational challenges, streamlines demand forecasts, improves supply chain, and drives business growth.

So, the cooler company engaged with Forsys to implement Oracle Planning Central, enhance the supply chain, and achieve business goals. After implementation, the client saw a 250% time saving due to automation, optimized inventory led to $1M in savings, increased on-time delivery, and more.

Problem Statement

The key challenges that made the client look for a solution were:

- Increased demand pattern and poor forecast demand
- Increased risk of supply disruption. Inability to identify risks and mitigate them
- Failed to adopt different fulfillment strategies within a single global supply chain plan
- Lacked an integrated view of demand and supply chain

Solution

Forsys implemented Oracle Planning Central to simplify demand planning and sales & operations planning. The client also wanted to retain business transactions in Oracle E-Business Suite (EBS). So, Forsys completed the implementation plan in two phases (client's preference).

Forsys used its own product **FloData** to connect the on-premises applications to the cloud and seamlessly integrate data between applications using File-Based Data Import (FBDI) templates. In the process, Forsys mapped the attributes of the crucial FBDI templates from the Source EBS system. Forsys used **FloData** to collect and load the master data and transaction data from the EBS source into the Oracle Planning Central cloud and simplify the implementation process.

Benefits

Since the go-live, the client has witnessed the following:

- Increased forecast accuracy based on supply chain inventory.
- Reduced order-rescheduling instances.
- Boosted supply chain data accuracy. Reduced data latency.
- Recognized the demand-supply balance of the stock-keeping units using the daily plans & simulation in real-time.
- Optimized inventory management led to $1m in savings.
- Increased on-time delivery and revenue stream due to accurate forecasting.
- Reduced end-to-end planning cycle time and addressed demand variability
- Integrated supply chain planning and demand forecasting on the cloud
- Resulted in a 250% jump in time savings due to automation.

About the Client

The client, headquartered in Katy, Texas, manufactures ice chests, drink containers, and supporting accessories. The client also manufactures coolers and offers 500+ products that are essential for road trips, summer vacations, camping, and outdoor activities.

Technology/Tools

Oracle Planning Central Cloud, **FloData**
