Reduction in Service Ticket Volume with Optimization of Supplier Relationship Management App

Insight

A leading global revenue lifecycle management company wanted to streamline and standardize its supplier relationship management (SRM) app by eliminating the operational silos. The absence of a standard support framework and a lack of coordination between application development and support activities proved to be a blocker.

Forsys optimized the client's SRM app to ensure the code was up-to-date with SFDC API versions, triaged defects and addressed the enhancement requests, scoped backlogs in sprints, and delivered changes per the release management cycle, which improved the scalability, accelerated the time to market, and reduced the support tickets.

Industry	Revenue	Employees	Headquarters
Software Development	$400 M	14k+	Colorado, US

Business Challenge

The client lacked the domain expertise, resources, and processes to optimize the SRM app and update its code with SFDC API versions and resolve the bugs during production.

Transformation Journey

Forsys set up a team to collate the requirements, organized a knowledge transfer session to compile the app-related documentation, and then launched the app optimization process.

The key highlights of the transformation journey are:

- Updated the app with the SFDC API versions
- Triaged defects & deployed enhancements
- Scoped backlogs in sprints
- Delivered changes as per the release management cycle

Impact

After the optimization was completed, the client:

- Reduced the service tickets
- Improved scalability
- Accelerated time to market
- Responded faster to the customer

About the Client

The client is a leading Quote-to-Cash automation software solution provider that delivers the most scalable revenue lifecycle management solution to help companies crush operational complexity. With global operations spread across North America, Europe, and Asia, the customer boasts a strong 1000+ customers.
