Case Study

Global video delivery technology conglomerate uses Forsys to handle its Oracle Cloud Suite migration confidently

About The Client

The San Jose-based client is a worldwide leader in video delivery technology solutions and enables media companies and service providers to deliver ultra-high-quality broadcast and OTT video services to consumers globally. Incorporated over 25 years ago, the client revolutionized cable access networking via the industry's first virtualized CCAP solution, enabling cable operators to more flexibly deploy gigabit internet service to consumers' homes and mobile devices.

The Background

The video technology giant moved to the Oracle On-premise (Finance, SCM, CRM) more than two decades back. Since then, there have been multiple changes in their processes and best practices. The legacy applications had grown in size and complexity leading to higher infrastructure cost and hampering performance. The client was desperately looking for ways to curtail cost and modernize their infrastructure for reliability, scalability, flexibility and performance to meet future organizational demands.

Before undertaking the migration of their mission-critical applications and processes to Oracle Cloud Suite, the client wanted to evaluate its capabilities and suitability to ensure successful and seamless migration. This was why our client engaged with multiple vendors to identify a futuristic and reliable solution provider capable of modernizing their efforts to make the switch to Oracle Cloud efficient.

The Challenges

The client had been rapidly growing with record new bookings, sequential, quarterly and year-over-year revenue growth. Despite recognizing the need for Cloud migration, the client remained wary about transitioning to the Oracle Cloud. It wanted to be fully sure that it will be able to leverage all of its preferred applications uninterrupted. The absence of Cloud proved to be a technical nightmare for the client and led to the below-mentioned challenges:

- Inconsistent parent and child account relationships (for example, one child account comprising multiple parent accounts) impacted the chart of accounts hierarchy.
- Monthly/quarterly end process was taking over 4 days to complete.
- Current application couldn't fully support intercompany transactions for cross charges.
- Manual handling of the statutory requirement of France to meet Generally Accepted Accounting Principles (GAAP).
- Higher depreciation cost compared to the actual cost for a few assets.

- Data cleansing, removing duplicates, filtering redundant and outdated data.
- Data reconciliation by performing validation within the source system as well as between source and destination.
- Moving reports from the Financial Statement Generator to Fusion Reporting Studio involved careful mapping between the On-Premise data and equivalent Cloud fields.
- Data (open and closed transactional data) analysis based on jurisdiction and regulations.

The Solution

The client wanted to migrate to Oracle Cloud Suite to optimize their operations and to transform Finance, SCM, HR and CRM processes. After evaluating a couple of different solution providers, the client remained frustrated with the level of inflexibility they continued to encounter. On top of it, none of them provided a proof of concept (POC). That is until they found Forsys. Our unique expertise in the Oracle Cloud space and 20+ years of experience handling multiple Oracle Cloud Projects impressed the client.

Forsys provided an Oracle Cloud proof of concept (POC) to understand their current landscape and expectations to deliver a seamless experience. Forsys' Cloud experts defined the business requirements, technical requirements, identified and resolved the gap areas before kick-starting Cloud migration. Owing to the scale and complexities involved, Forsys recommended a phased approach to migration, starting with Finance, to ensure all the teams are unaffected. The POC resulted in a hybrid Cloud-On Premise application landscape for the client and integrations were built between Finance on Cloud and the On-Premise modules, including third-party tools.

Some of the key activities taken up by Forsys to ensure a smooth and seamless migration included:

- POC and Demo on Oracle Cloud (General Ledger (GL), accounts payable (AP), accounts receivable (AR), Fixed Assets (FA), Order Management (OM) and Inventory (INV) for two business units (the US and France), enabled France GAAP Rules.
- Setting up of the Financial Report Centre (FRC).
- Enabled Infolets in Oracle Fusion Applications to display key information about the client.
- Performed Data Conversion (GL Balances, Currency Conversion, Open AR Invoices, Open AP invoices, Customers, Suppliers and Assets).
- Successful integration of Master Data and Transactional Data.

Benefits & Results

To prepare the client for cloud adoption, Forsys developed both short-term and long-term roadmaps and included them in the POC that empowered the client to achieve the below-mentioned results:

- Data readiness helped improve the implementation time by 25%.
- Quickly closed the existing and ongoing customizations.
- Forsys built Accelerators (Flodata) for Data Migration and Integrations with third-party tools helped save 30% cost and time.
- Drastically reduced month/quarter end process to one day.
- Optimized reporting center with contextual collaboration enabling anytime, anywhere access.
- Automated journal entries in the primary ledger to transact to the secondary ledger to ensure French GAAP requirements are met.
- Asset transactions could get reflected in the secondary ledger as soon as the transactions are interfaced to GL, as per the France Statutory requirements.
