Forsys streamlines end-to-end business processes and implemented Oracle SOA Suite for a global software major

About The Client

Founded in 1999, the San Jose-based client is a leading global provider of the cloud and software platforms, systems, and services required to deliver the unified access network and smart premises of tomorrow. Our client's platforms and services help customers build next-generation networks by embracing a DevOps operating model and optimizing the subscriber experience by leveraging big data analytics. Communications service providers rely on this conglomerate to help them master and monetize the complex infrastructure between their subscribers and the cloud.

The Background

The client faced rising demands from different departments to refresh their storage solution. Reason? The need for a sophisticated IT system created an environment where skilled employees were spending crucial work hours on maintenance and operations instead of focusing on functions and tasks furthering the company's strategic growth plan.

As per the game plan, the client wanted to migrate to Oracle Cloud from the On-Premise Oracle application (R12 version). As part of this move, they were looking for a complete end-to-end solution capable of supporting data conversions for accounts payable (AP), accounts receivable (AR), purchase order (PO), inventory, and order management (OM).

The Challenges

The client team looked at multiple options from varied vendors, but none of them succeeded in devising a strategy that focussed on addressing the issues arising from incomplete data stored across business applications.

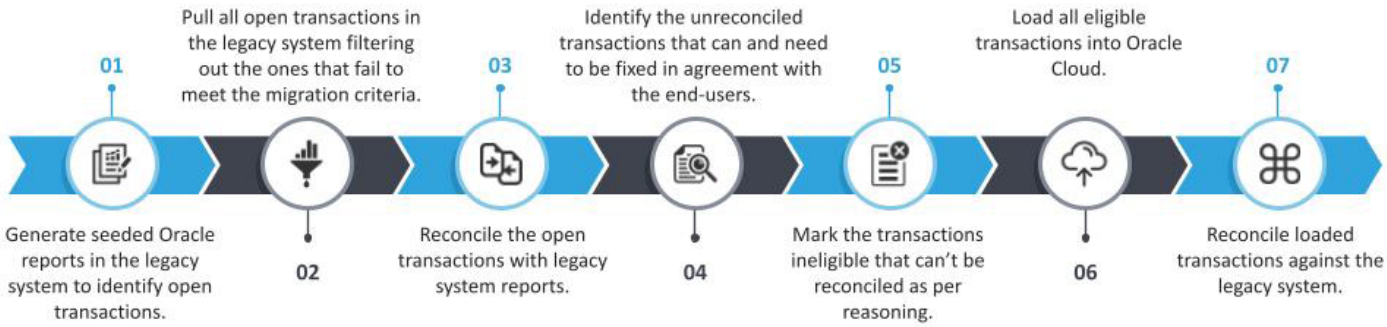
With data ownership and delayed identification of data issues as key roadblocks, it made the client continue its search for a holistic vendor capable of addressing unplanned data migration issues and resolve problems arising from inconsistent data causing business functions to fail during data migrations from legacy to target applications.

Below are some of the key migration challenges that the client faced with other vendors:

- Unrealistic estimates of data quality and unable to process high-volume data.
- Matching the data variants to Oracle data types.
- Old transactions marked for closure continued to remain open in the source system before migrating to Oracle Cloud.
- Inaccurate, missing or out of date source system documentation.
- Inability to reconcile the target system data to the source system.
- Failed to identify the eligible transactions to move to the target application.
- Incapable of identifying business sign off for non-eligible transactions.
- Ensure and maintain regulatory compliances.
- Supporting 100% data migration to Oracle Cloud.
- Zero tolerance to any interruption or performance impact throughout the entire migration process.
- Business sign off for non-eligible transactions identified based on accurate reasoning.

The Solution

The client came to realize that to handle roadblocks and ensure a smooth trajectory for process optimization, a structured cloud migration strategy is imperative. By partnering with Forsys, the client was convinced of achieving success when our team designed a seven-step detailed, failproof implementation roadmap as mentioned below:



Benefits & Results

The Forsys team conducted a thorough and detailed data validation before running the data reports, ensuring a seamless migration experience for the client. This came in handy to identify the exception scenarios which then could be managed proactively in a single block, saving business users' time and effort, and establish data ownership right at the start of the process resulting in a seamless move to production without any hindrances.

The customer was impressed with how the data migration was transparent and caused no impact on production.

- The whole migration was completed with a saving of about 80% time and effort.
- Host cutover was successful in the first attempt.
- Improved cost efficiency by 60%.
- Downtime was reduced drastically by 50%.
