Learn how Forsys leveraged Oracle Integration Cloud services to help a global software major to streamline integration between disparate systems

About The Client

Founded in 1999, the San Jose-based client is a leading global provider of the cloud and software platforms, systems, and services required to deliver the unified access network and smart premises of tomorrow. Our client's platforms and services help customers build next-generation networks by embracing a DevOps operating model and optimize the subscriber experience by leveraging big data analytics. Communications service providers rely on this conglomerate to help them master and monetize the complex infrastructure between their subscribers and the cloud.

The Background

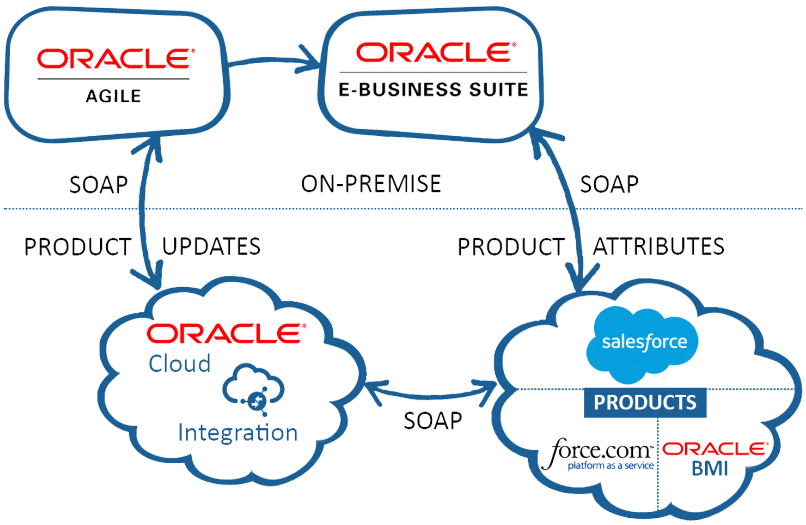
The client's application landscape consisted of disparate products from multiple providers. They made use of Oracle Agile for Product Lifecycle Management, Oracle E-Business Suite (EBS) for Enterprise Resource Planning (ERP), Salesforce for Customer Relationship Management (CRM) & Oracle Big Machines for configure, price, quote (CPQ).

The Challenges

The client's business was growing rapidly, and they required an effective and scalable approach for application integration. While the business teams ensured the seamless management of the product information flow across the independent applications, however, there was no integration built between Agile, EBS and Salesforce leading to data inconsistencies in the downstream systems. The client was spending a lot of time and effort fixing the discrepancies. Moreover, to keep things steady and further the business initiatives, the tech major lacked pace.

The Solution

As the team started looking for options, Forsys quickly emerged as the winner. Forsys used Oracle Integrated Cloud Service (OIC), a cloud-based integration tool, to achieve seamless integration between disparate systems. Forsys' two-step approach helped the entire project go live in less than 10 weeks.



AGILE PLM, ORACLE EBS, SFDC Integration using Oracle ICS

- Integrated Oracle Agile PLM with Oracle EBS and Salesforce. The Oracle Agile Event Handler was used to capturing changes in the product information and pass the data to OIC which in turn leveraged a used Salesforce API to push the changes into Salesforce.
- Integrated Oracle EBS and Salesforce with the help of OIC which worked by using a Java concurrent program to capture changes in the product information and pushing it to Salesforce.

Benefits & Results

Since the go-live, the client has witnessed a series of benefits comprising:

- Near real-time integration between Agile, EBS and SFDC.
- Accurate quotes with integrated product information from the master product and pricing systems.
- Agile product lifecycle management (PLM) application now acts as a single source of truth for product management for downstream systems.
- Orders captured on Salesforce order management have accurate product & pricing information.
- Hassle-free management of sync failures for the users with timely updates helped improve the adoption rate in their existing systems.
- Zero defects project delivery and no bugs reported after going live.
