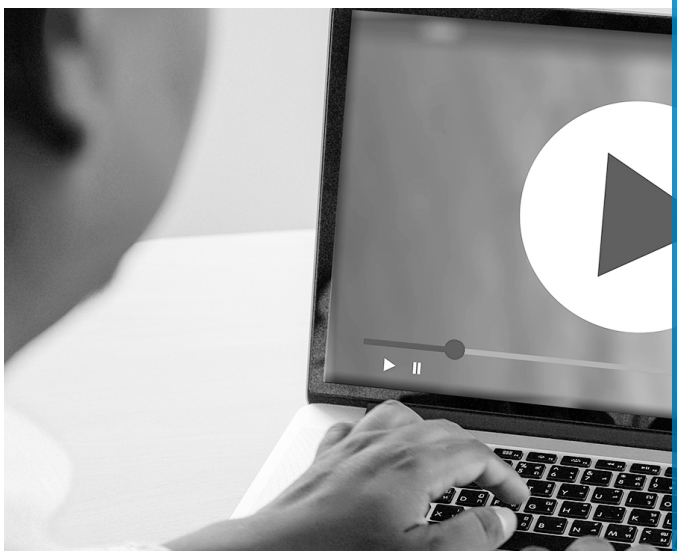
Case Study



About the Client

The client is a worldwide leader in Video Delivery Technology solutions and the first to provide broadcasters, pay-tv operators, service providers, and other media companies with operational video efficiency that is ready to deploy on a global scale.

The Background

The client had last implemented Oracle On-premise (Finance, SCM, CRM) two decades ago and since then there have been many changes in their processes and best practices. They faced challenges on multiple fronts. For example, challenges in the Finance area included, but not limited to:

- Inconsistent Parent and child account relationships (for example, one child account comprising multiple parent accounts) impacting the chart of accounts hierarchy.
- Monthly/Quarterly End process was taking more than 4 days to complete.
- The current application did not fully support Inter Company Transactions for cross charges
- Statutory requirement of France to meet FR GAAP was handled manually
- Depreciation cost more than actual cost for a few assets

Before undertaking the migration of their mission-critical applications and processes to Oracle Cloud Suite, the client wanted to evaluate it's capabilities and suitability to their organizations to ensure a good fit and a seamless migration.

Solution

The Client wanted to migrate to Oracle Cloud Suite to optimize their operations and to transform Finance, SCM, HR and CRM processes. To analyze their existing systems and provide a plan for a successful migration, they chose Forsys for their unique expertise in the Oracle Cloud space and extensive experience of multiple Oracle Cloud Projects.

Forsys provided the client with an Oracle Cloud POC to understand the client's current landscape and expectations in order to deliver a seamless experience. Forsys' team of Cloud experts defined business and technical requirements and identified possible pain points and impediments, helping the client to resolve and mitigate them before migrating to Cloud. Owing to the scale and complexities involved, Forsys recommended a phased approach to migration starting with Finance. The POC resulted in a hybrid Cloud-On Premise application landscape for the client. Integrations were built between Finance on Cloud and the On Premise modules, including third party tools.

The Challenges

There were challenges involved in the migration, a few of which were:

- Analyzing the volume of historical data to be migrated (Open and Closed Transactional Data) based on jurisdiction and resulting regulations
- Data Cleansing, removing duplicates, filtering redundant and outdated data
- Data reconciliation needed to be done by performing validation within the source system as well as between source and destination
- Setting expectations with end users and getting their support and time for key activities was a challenge. The ground work done by the Forsys team helped pave the way for faster Org adoption
- Moving reports from Financial Statement Generator to Fusion Reporting Studio involved careful mapping between the On Premise data and equivalent Cloud fields.

Key Activities

POC and Demo on Oracle Cloud (GL, AP, AR, FA , OM, INV) for two business units (US and France), enabled France GAAP Rules

Setting up of FRC (Financial Report Centre)

Enabled Infolets in Oracle Fusion Applications to display key information about the client

Performed Data Conversion (GL Balances, Currency Conversion, Open AR Invoices, Open AP invoices, Customers, Suppliers and Assets)

Integrations of Master Data and Transactional Data

Benefits

Early adoption of Cloud via the POC enabled the client to gain the following benefits:

- Prepared stakeholders & gathered **budget approvals** before the final migration
- Saved 25% implementation time due to **Data Readiness**
- **Accelerated closure** of the existing customizations
- Leveraged Forsys built Accelerators (Flodata) for Data Migration and Integrations with 3rd Party Tools and **Saved 30% Cost and Time**
- Reduced their Month/Quarter End Process from **four days to one day**
- Optimized reporting center with Contextual collaboration enabling **anytime, anywhere access**
- Journal entries in primary ledger could transact to secondary ledger automatically to **support FRGAAP requirements**
- Asset transactions could get reflected in secondary ledger as soon as the transactions are interfaced to GL, as per the **France Statutory requirements**
